PREVIEWGATE BY PRETXSIM · APPSFACTORY ACCELERATOR

The pre-execution policy engine for Canton Network & cross-chain capital.

Deterministic, non-consuming transaction rehearsal for **Daml smart contracts** and multi-chain agentic rails — with zero sub-transaction privacy leaks. One engine, two rails: **PreviewGate** on Canton, **PreTxSim** on EVM.

6/6	0	2 rails
Daml proofs held — Canton MVP live	bytes of tx data shared with third parties	Canton flagship · EVM expansion

PROBLEM

01 Intent is opaque before settlement — on every ledger

On Canton: atomic but blind

Commits are atomic — yet **intent is opaque prior to settlement**. A payer staring at a contract ID can't answer "what will this do, and is it inside my mandate?" Public RPC dry-runs leak enterprise **sub-transaction privacy metadata** to external nodes — unacceptable for treasuries, RWA issuers, and agent operators.

On EVM: blind and drained

Wallet-drainer phishing stole **$494M in 2024** (+67% YoY). And every serious simulation fix — Blockaid ($83M raised), Tenderly — executes **on vendor servers**, leaking trade flow and treasury moves. (Alchemy killed its sim APIs in Sept 2026.)

> The gap: no **deterministic, privacy-preserving pre-execution layer** exists for either world. PreviewGate fills it on Canton; PreTxSim fills it on EVM.

SOLUTION · TWO RAILS, ONE ENGINE

02 Deterministic rehearsal before anything commits

The same thesis on both ledgers: **show exactly what will happen, gate what shouldn't** — with zero privacy leakage.

Canton / Daml — PreviewGate (flagship)

- Non-consuming `Preview` choices evaluate owner policy bounds (`GatedPayment`) in-memory — **no state commits**
- In-policy settles; out-of-policy escalates to single-use owner grants
- Every claim proven by Daml Script; one-command `verify.sh`

EVM / cross-chain — PreTxSim (expansion)

- Air-gapped `:8545` proxy: local **revm** traces for bridge & agent flows
- `RiskInspector` + offline Ollama brief; `--ci` JSON reports that fail builds
- Wallets, bots, agents, CI — zero integration cost

PRODUCT · LIVE TODAY, BOTH RAILS

03 Working software, not slides

```
$ damlc test  # Canton Network (Daml)
[*] PolicyGateTest: 6/6 claims held (Preview → ExecuteApproved)
[*] Verdicts: EXECUTABLE | REQUIRES_APPROVAL — 0 privacy leak
```

```
$ curl -X POST 127.0.0.1:8545 -d '{"method":"eth_sendTransaction", ...}'
[*] Local revm trace → RiskInspector → Ollama brief
[+] PASS / WARN — zero data leaves the box
```

✓

Daml proofs green · Rust build green · `--ci` tested

✓

One-command reproduce on both rails

✓

Runbooks + demo assets shipped in-repo

MARKET

04 A validated category with a privacy vacuum

$494M

stolen by drainers in 2024 — the demand signal

$83M

raised by Blockaid alone — the category is venture-scale

6.3B

transactions scanned by the leader — simulation is default infra now

Wedge strategy: win **Canton enterprise first** — treasuries, RWA issuers, node operators with zero tolerance for intent leakage — then carry the same engine outward to EVM agent rails and self-hosted CI as the open standard.

BUSINESS MODEL

05 Open core, paid perimeter

Free forever

Core proxy, RiskInspector, `--ci` — open-source. Distribution and trust.

Paid

Policy packs (compliance rule-sets), **team fleet** management + audit trails, **SLA support** for treasuries and agent operators.

Why it wins

Zero marginal serving cost (runs on the customer's box). Land via developers, expand via compliance officers.

COMPETITION

06 We don't out-data them. We out-position them.

EVM: cloud intelligence

Blockaid (6.3B txs of labels), Blowfish/Phantom, WalletGuard/MetaMask, Tenderly. Moat = **data network**. Price = **your transaction flow**. We out-position them with locality + `--ci` enforcement.

Canton: open field

HackCanton entries do **enforcement** (spending limits, collateral registries) — **nobody does preview**. PreviewGate is the only pre-execution rehearsal layer for Daml: see-before-settle with zero privacy leakage.

> One-liner: **they simulate your transaction on their servers — we rehearse it inside your perimeter.**

TEAM

07 Technical solo founder, shipping in public

Builder profile

Rust + EVM internals (`revm`), local-LLM systems, DevSecOps pipelines. Grant-track record: W3F, Arbitrum, Optimism, Ethereum ESP applications prepared; ZK + agent infrastructure background.

Operating style

Proof over pitch: every claim ships with a reproducible runbook. PreviewGate (6/6 Daml proofs green) plus PreTxSim (tested `--ci` gate) — both built and verified in days, in public.

> Hiring needs: none yet — leverage is code. First hire post-traction: DevRel / partnerships for wallet + agent-treasury distribution.

THE ASK · CANTON FIRST

08 Canton is the flagship; EVM is the expansion

Canton Network is our initial enterprise launchpad — institutional treasuries, RWA issuers, node operators. Public EVM chains are the secondary expansion vector for the same engine.

Design partners

One Canton treasury/wallet team on PreviewGate policy envelopes; one agent operator on PreTxSim rails. Shadow-mode pilots, compare catches.

With AppsFactory

Mentorship on Canton go-to-market, DevNet deployment path, intros to RWA + treasury builders in the ecosystem.

Capital

Pre-seed to harden PreviewGate (recurring policy registries, Canton Coin settlement), expand EVM multichain, and ship compliance policy packs.
